

**Abstract of th Disclosure**

In a mobile communication system, a mobile terminal transmits a request with a parameter of an event selected previously or a telephone number corresponding to a received call to a server through a base station and a network based on a program. The server retrieves schedule data corresponding to the parameter from a server storage unit and transmits the retrieved schedule data to the mobile terminal through the network and the base station. The mobile terminal stores the retrieved schedule data in a terminal storage unit based on the program.
